#### 2 PURPOSE

The purpose of this procedure is to:

- 1. Ensure that risk management is embedded in Qatar Steel Company's culture and practices;
- 2. Ensure a systematic approach to risk management;
- 3. Ensure that hazards are identified, risks are evaluated and appropriate control measures are implemented and monitored; and
- 4. Describe specific risk assessment methodologies which can be applied and against which compliance can be measured.

#### 3 SCOPE

This procedure shall apply to all workplace hazards and risks, and all activities undertaken by Qatar Steel and include:

- The routine, and non-routine, activities of all persons having access to the workplace;
- 2. Hazards associated with plant, machinery and equipment;
- 3. Hazards associated with substances and materials in the workplace;
- 4. Hazards originating outside of the workplace that could adversely affect the work environment;
- 5. Hazards associated with inclement weather or emergency situations; and
- 6. The complete lifecycle of facilities from specification through to decommissioning and disposal.

P&ID: Piping and Instrumentation Diagram

PFD: Process Flow Diagram

PPE: Personal Protective Equipment

RACI Responsible, Accountable, Consulted, Informed

SOP: Standard Operating Procedure QSC: The Qatar Steel Company

#### **Definitions:**

Routine	Routine work are jobs and tasks done at certain defined intervals, to
Activity:	facilitate the normal operation of the plant.
Non- Routine	Non-routine work are jobs and tasks that are performed irregularly or
Activity:	being performed for the first time.
	Since these tasks and jobs are not performed regularly, it can be
	difficult to understand all of the hazards associated with the job.
	Non-routine work includes jobs or tasks that are, (But not limited to):
	Performed infrequently;
	Outside of normal duties;
	Do not have a documented procedure;
	<ul> <li>Performed in a different way from documented procedure;</li> </ul>
	Have never been performed before; and
	Routine tasks that carry a high level of risk.
Hazard:	A hazard is any chemical or physical condition that has potential to
	cause damage to people, assets and/or the environment.
Probability:	Probability is the likelihood or chance of an event occurring
Risk:	Risk is defined as the measure of human injury, environmental
	damage, or economic loss in terms of both the incident likelihood &
	the magnitude of the loss or injury.
Residual risk:	Residual risk is the risk remaining, associated with a job or an activity
	after the precautions are taken.
Severity:	Severity describes the highest level of damage possible when an
•	accident occurs from a particular hazard.
Risk Ranking:	Numerical value given to the level of risk based on risk matrix.
Controls:	Precautions put in place to reduce the risk.

Hazard Identification, Risk Assessment	Prepared by: HSE Department
and Risk Management	Issued by: HSE Department
Page 7 of 40	COS 2 Spannion

Procedure	2.32.2.1.03.01
Established	28-Mar-1994
Effective Date	09-Sep-2021
Revision	1.00

The risk management process can be divided into five steps:

- 1. Identify the hazards;
- 2. Identify who is at risk or what can be damaged and how;
- 3. Evaluate the risk and identify any additional control measures necessary to reduce the risk to As Low as Reasonably Practicable (ALARP);
- 4. Implement the control measures in the workplace; and
- 5. Monitor and review the effectiveness of the control measures.

The aim should be to eliminate the hazard or risk wherever practicable. Where it is not possible to eliminate the risk then a hierarchy of controls can be applied ranging from substitution (i.e. the use of less hazardous substances, materials, equipment or processes), through to the application of engineering or administrative controls, and finally the use of personal protective equipment (PPE).

Qatar Steel employs the use of two interrelated processes for the assessment and control of workplace risks:

- 1. Hazard Identification and Risk assessment (HIRA);
- 2. Job Safety Analysis (JSA).

At the highest level in the risk assessment hierarchy is the HIRA. This is used to evaluate the hazards, risks and controls associated with QATAR STEEL facilities and jobs. JSA process shall be used to provide another level of detail.

Where the HIRA process identifies risks associated with the operation and maintenance of machinery then risk relevant to man machine interface to be considered. For the purposes of this procedure machinery shall include:

- 1. Moving equipment (rotating and reciprocating);
- 2. Pressure vessels with an internal diameter more than 152 mm and a maximum allowable working pressure (MAWP) more than 15 psig; and
- 3. Static equipment with a surface temperature more than 700°C.

The ISA process shall be applied for non-routine activities which are not covered in HIRA & all contractor activities. This process breaks jobs up into a series of sequential activities and is used to assess the hazards, risks and controls associated with each activity.

An overall, high-level flow diagram for the risk management process is given as Figure 1

Hazard Identification, Ris	sk Assessment
and Risk Management	

Prepared by: HSE Department

**Issued by:**HSE Department

Page 8 of 40

Procedure	2.32.2.1.03.01
Established	28-Mar-1994
Effective Date	09-Sep-2021
Revision	1.00

#### 4.2 HAZARD IDENTIFICATION AND RISK ASSESSMENT (HIRA)

The objective of the HIRA process is to provide a systematic basis for the identification of hazards, risks and controls associated with Qatar Steel facilities and activities and to ensure that all risks are maintained at As Low as Reasonably Practicable (ALARP) level. It is intended to be a working document that Qatar Steel personnel can use to help them understand the workplace risks and manage them effectively. The identification, implementation and maintenance of effective controls is key to ensuring that all workplace risks are appropriately managed. Employee and contractor participation, consultation and communication are key to a successful outcome.

#### 4.2.1 Applicability

The HIRA process shall address:

- 1. Routine, and non-routine, activities;
- 2. Hazards associated with plant, machinery and equipment;
- 3. Hazards associated with substances and materials in the workplace;
- 4. Hazards originating outside of the workplace that could adversely affect the work environment;
- 5. Hazards associated with inclement weather or emergency situations; and
- 6. The complete lifecycle of facilities from specification through to decommissioning.

#### 4.2.2 Methodology

A flow diagram for the HIRA process is given as *Figure 2*. The worksheet given in **Appendix 1 - HIRA Worksheet** shall be used to record the results of the analysis. A team member shall be nominated to facilitate the HIRA sessions and another to compile the worksheet as the analysis progresses. The role of the facilitator is to: lead the team; prompt the brainstorming effort; manage the discussion without compromising creativity; identify the key issues; and ensure that the worksheet accurately reflects the points discussed.

The HIRA process can be broken down into the following basic steps:

- Select the job which is to be considered;
- 2. Describe the job which is to be carried out;
- 3. Brainstorm all the potential hazards and risks associated with the job:
- For each identified hazards, elaborate the worst-case scenario that may occur without considering any safeguards or existing controls;
- List down the existing controls to prevent and/or minimize impact of the consequence;
- 6. Evaluate the probability, severity in terms of people, asset, environment, company reputation and assess the level of current risk considering the existing controls are

Hazard Identification, Risk Assessment	Prepared by:
,	HSE Department
and Risk Management	Issued by:
e e	HSE Department
Page 9 of 40	

Procedure	2.32.2.1.03.01
Established	28-Mar-1994
Effective Date	09-Sep-2021
Revision	1.00

in place;

- 7. Identify any remedial action / additional controls required for further risk reduction mentioning a responsible party, target date and action status. When the target date is passed, the action status has to be changed. If no additional action then the remedial action field should mention "Nil" and residual risk will remain same as current risk;
- 8. If an engineering control is introduced as remedial action, the severity or probability or both can be reduced more than one order of magnitude (i.e.; 4C to 2C or 3D to 3B). If an administrative control is introduced the severity or probability or both cannot be reduced more than one order of magnitude (i.e.; 4C to 3C or 3D to 3C). This is due to the fact that, administrative controls are easy to breach, requires regular monitoring on the implementation, whereas an engineer control act as an active barrier;
- 9. Assess the residual risk following implementation of the proposed actions or controls. The credit of risk reduction can only be taken with reduced risk ranking on the residual risk if recommended additional action item has been implemented and there is a "Closed" status of remedial action. After implementing additional control, it should remain in same column irrespective of any HIRA revision with status "Closed" so that the difference can be easily identified between "Current Risk" with existing control & "Residual Risk" with additional control. With "Open" status of remedial action, the residual risk will be same as the current risk; and
- Select the next area of the plant or the next job and repeat the above mentioned process until the HIRA is complete.

The checklist of potential hazards and controls given in Appendix 2 - Checklist of Potential Hazards can be used by HIRA assessment teams. This checklist is only intended to be a prompt and is not a substitute for the effective implementation of the HIRA process by knowledgeable and experienced personnel. The teams should have access to any supporting information or documentation that might add value to the assessment such as details of previous incidents, Process Flow Diagrams (PFDs), Piping and Instrumentation Diagrams (P&Ds), Material Safety Data Sheets (MSDS) plant layouts etc.

The Qatar Steel qualitative risk matrix shown in *Figure 3* shall be used to assess the probability of occurrence and potential severity of the scenarios considered, which will in turn define the level of risk (i.e. no risk, low risk, medium risk or high risk). The risk is assessed based on the potential impact on people, assets, the environment and company reputation. The risk level recorded in the HIRA worksheet is taken to be the highest observed for these four categories. Further guidance on how to assess the severity of the consequences is given in **Appendix 4** -Consequence and Frequency Category Definitions.

Hazard Identification, Risk Assessment
and Risk Management

Prepared by: HSE Department

Issued by:

**HSE** Department

Page 10 of 40

Procedure	2.32.2.1.03.01
Established	28-Mar-1994
Effective Date	09-Sep-2021
Revision	1.00

Where the HIRA process identifies risks associated with the operation and maintenance of machinery then risk relevant to man machine interface to be considered. The JSA process shall be applied for non-routine activities which are not covered in HIRA & all contractor activities.

#### 4.2.3 Risk Acceptance

Based on the risk level, as derived from the Qatar Steel risk matrix (*Figure 3*) and assigned during the HIRA assessment, the following actions shall be taken to ensure effective risk management.

#### High Risk

If the residual risk is high, then the operation or activity shall be stopped until additional controls can be implemented or an alternative process or activity can be found that will reduce the risk to an acceptable level.

#### Medium Risk

If the residual risk is medium, then the assessment team needs to be satisfied that the identified controls are implemented and effective and that no additional controls can be identified to further reduce the risk (i.e. the risk is ALARP).

#### Low Risk

If the residual risk is low, it is still important to make sure that the identified controls are implemented and effective and to be aware of further opportunities for improvement.

#### 4.2.4 The Assessment Team

The selection of the assessment team has a direct effect on the usefulness and quality of the HIRA process. The assessment team shall consist of personnel that are knowledgeable about the plant being considered, its operation and maintenance, the materials used and the activities to be undertaken. The team can be relatively small but it should contain sufficient knowledge and expertise to be able identify all the hazards and the risks associated with the plant and the activities.

The assessment team should include: the plant supervisor/engineer for the plant; operations representatives (supervisor, senior operator) due to familiarity with the operation of the unit/plant; maintenance representatives (supervisor, senior technician) due to having specific knowledge about the control and safeguarding of unit/plant and an HSE representative. The HSE representative shall ensure consistency of approach and provide input on the hazards, risks and the potential severity of the consequences. Operation or maintenance representative will be involved based on the nature of the task whether it is operational and/or maintenance activity. Where specialist knowledge is required to address specific hazards or risks then additional team members can be temporarily included as necessary.

Effective Date	09-Sep-2021
Revision	1.00

#### 4.2.5 Roles and Responsibilities

A RACI chart for the HIRA process shown in *Figure 2* is given as *Table 1*. The RACI chart defines who is responsible and accountable for each step in the process and who needs to be consulted or informed.

#### 4.2.6 Timing of Assessments

HIRAs shall be reviewed and updated when:

- 1. There is a change to the existing plant or new facilities are added;
- 2. There is a change to the hazards, operational environment or working conditions;
- 3. There is a change to the activities undertaken or new activities are proposed; and
- There has been an accident or high potential near-miss.

Any changes in the HIRA shall be circulated to all concerned agencies and all the changes must be documented. Each HIRA shall be subject to review at least every three years from the date of the last revision if there have been no changes.

#### 4.2.7 Deliverables

The deliverable from the HIRA process shall be a fully completed worksheet that has been assessed by the relevant Engineer or Section Head, reviewed by HSE and approved by the Department Manager. A PDF copy of the approved HIRA shall be added to the HIRA database located on the Qatar Steel computer network. The department management should identify a convenient mechanism to verify that employees understand their SOPs, HIRA and other work support documents apart from acknowledgement. Also, any update on the current HIRA to be communicated within the department to ensure employee involvement.

#### 4.2.8 Verification of Controls

After completion of the HIRA it is the responsibility of the line management of the concerned department to:

- 1. Disseminate the key findings from the HIRA and specifically highlight any medium or high risks and their associated controls; and
- 2. To check that the identified controls have been implemented and are being complied with in the field.

Checking the effectiveness of controls can be achieved through the inspection of documentation such as SOPs, method statements, work permits, inspection and maintenance records, training records; and through direct observation.

### Hazard Identification, Risk Assessment and Risk Management

Prepared by: HSE Department

Issued by:

**HSE Department** 

Page 12 of 40

Procedure	2.32.2.1.03.01		
Established	28-Mar-1994		
Effective Date	09-Sep-2021		
Revision	1.00		

#### 4.2.9 Audit and Review

Quarterly audits shall be carried out by the HSE department to check that HIRAs are being carried out in accordance with this procedure and that the associated controls are being implemented in the field. Any non-conformances and corrective actions shall be fully documented and brought to the attention of the relevant Department Manager for action and resolution.

#### 4.3 JOB SAFETY ANALYSIS (JSA)

Job Safety Analysis is an important tool that is used to identify hazards and risks before a job is performed and before they can result in injuries or damage. The aim being to eliminate the hazards or put controls in place to minimize them. Jobs are broken down into a series of steps or tasks. The hazards, risks and controls associated with each task are then identified. The JSA is used to during:

- 1. Work permits (according to applicability mentioned in section 4.4.1);
- 2. Toolbox talks;
- Training materials for new employees; and
- 4. Refresher training for established employees

#### 4.3.1 Applicability

A JSA shall be carried out:

- 1. For non-routine jobs which are not covered in HIRA; and
- 2. For all contractor activities.

#### 4.3.2 Methodology

A flow diagram for the JSA process is given as *Figure 4*. The worksheet given in **Appendix 6** JSA Worksheet (Qatar Steel) shall be used to record the results of the analysis. A team member shall be nominated to facilitate the sessions and compile the worksheet as the analysis progresses. The input for developing a JSA will be the approved method statement or operating procedure from the user department/section.

The job is broken down into tasks each with recognizable starting and end points. If a job contains more than 15 tasks then consideration should be given to splitting the job up into discrete phases (e.g. preparation, execution, and close-out).

The tasks are listed in the worksheet and then the analysis proceeds task by task until all the tasks have been considered. Following review and discussion by the team the following information is added to the worksheet for each task:

Hazard Identification, Risk Assessment
and Risk Management

Prepared by:
HSE Department

Issued by:

**HSE** Department

Page 13 of 40

Procedure	2.32.2.1,03.01
Established	28-Mar-1994
Effective Date	09-Sep-2021
Revision	1.00

- 1. The potential safety issue, hazard or risk;
- 2. The potential causes that could lead to realization of the hazard or risk;
- 3. The potential severity of the consequences as per the Qatar Steel risk matrix;
- 4. The controls that needs to be implemented; and
- 5. The party responsible for implementing the controls.

The checklist of list of potential hazards (Appendix 2 - Checklist of Potential Hazards) and controls (Appendix 3 - Hierarchy of Controls) can be used by JSA assessment teams. This checklist is only intended to be a prompt and is not a substitute for the effective implementation of the JSA process by knowledgeable and experienced personnel. Where there are potential chemical hazards reference should always be made to the relevant MSDS.

#### 4.3.3 The Assessment Team

The JSA team shall include at least four members. The area supervisor, at least one senior operator or technician, depending on the nature of the job, contractor representative (for project activities) and a HSE representative. The HSE representative shall ensure consistency of approach and provide input on the hazards, risks and the potential severity of the consequences. To ensure that the JSA is both realistic and practical, it is essential that those that will be carrying out the work are responsible for its preparation. Where a job requires specialist knowledge then additional team members should be included as appropriate.

#### 4.3.4 Roles and Responsibilities

A RACI chart for the JSA process shown in *Figure 4* is given as *Table 2*. The RACI chart defines who is responsible and accountable for each step in the process and who needs to be consulted or informed.

#### 4.3.5 Timing of Assessments

JSAs shall be carried out as the need arises. A JSA shall be reviewed and updated whenever there is a significant change to the job or if a high potential near-miss or accident occurs related to the execution of the job.

#### 4.3.6 Deliverables

The deliverable from the JSA process shall be a fully completed worksheet shown in Appendix 6 - JSA Worksheet (Qatar Steel) that has been reviewed by the relevant Engineer or Section Head. For Contractor the JSA process shall be fully completed worksheet shown in Appendix 8 - JSA Worksheet (Contractor) done by the contractor and then be reviewed by the relevant engineer in accordance with Appendix 7 - JSA Approval Authorization Form under whom the contractor is working. The final JSA worksheet will be reviewed and approved by HSE within one (1) week of submission.

Page 14 of 40

Procedure	2.32.2.1.03.01
Established	28-Mar-1994
Effective Date	09-Sep-2021
Revision	1.00

#### 4.3.7 Verification of Controls

After completion of the JSA it is the responsibility of the line management of the concerned department to check that the identified controls have been implemented, and are being complied with, in the field. This can be achieved through the inspection of documentation such as SOPs, method statements, work permits, training records; and through direct observation of jobs.

#### 4.3.8 Audit and Review

Quarterly audits shall be carried out by the HSE department to check that JSAs are being carried out in accordance with this procedure and that the associated controls are being implemented in the field. Any non-conformances and corrective actions shall be fully documented and brought to the attention of the relevant Department Manager for action and resolution.

#### 4.4 ASSOCIATED STUDIES

There are a number of associated studies that are outside the scope of this procedure that can nevertheless provide useful input into the identification of risks and controls.

#### 4.4.1 What-if Analysis Study (What-if)

The What-If Analysis technique is a brainstorming approach in which team members familiar with the process ask questions about possible undesired events. This assessment technique asks a number of questions that begin with "What if" to attempt to identify any associated hazards.

#### 4.4.2 Hazard Operability Study (HAZOP)

A HAZOP is a structured and systematic assessment of processes or operations to identify and evaluate problems that may represent risks to personnel or equipment by examining the impact of deviations from normal operations.

#### 4.4.3 Hazardous Area Classification (HAC)

A HAC assessment involves the evaluation of a manufacturing or process facility to identify areas where potentially flammable atmospheres can occur, to enable the selection of equipment that will minimize the chances of ignition.

#### 4.4.4 Fire Risk Assessment (FRA)

A FRA is used to identify what needs to be done to prevent fires and protect personnel. It is a structured process for identifying fire hazards, the personnel at risk and what can be done to eliminate or reduce the risks.

Revision	1.00

#### 4.5 COMMUNICATION AND DISSEMINATION

For the risk assessment and management practices described in this procedure to be effective Qatar Steel personnel must be made aware of the workplace risks and the associated controls. The identification, implementation and maintenance of effective controls is key to ensuring that all workplace risks are appropriately managed. Employee participation, consultation and communication are essential to a successful outcome.

#### 4.5.1 QATAR STEEL COMPANY

This latest version of this procedure shall be made available to all Qatar Steel employees through the Qatar Steel computer network. It is a line management responsibility to ensure that the hazards, risks and controls identified through the application of this procedure are effectively communicated to supervisors and shop floor workers. A wide range of mechanisms are available to achieve this goal, including training, coaching and toolbox talks etc.

#### 4.5.2 CONTRACTORS

Qatar Steel has a responsibility to ensure that its contractors are made aware of the hazards, risks and associated controls that can affect them while working for QSC. It is the responsibility of the Qatar Steel contract supervisor to ensure that these are effectively communicated to contractors prior to the starting work on Qatar Steel facilities.

#### 4.8 AUDIT AND REVIEW

MCC

Annual second party audits shall be carried out to check that risk assessment and risk management activities are being carried out in accordance with this procedure. Any non-conformances and corrective actions shall be fully documented and recommendations to be suggested for improvement. This procedure shall be subject to review when an opportunity arises to make a significant improvement, or to address a concern, but the review date shall not exceed three years from the date of the last revision.

#### 4.9 MANAGEMENT OF PROCEDURAL UPDATE

No updates shall be made to this procedure without approval from the QATAR STEEL Risk Management Committee. Any suggestions or recommendations for updates or improvements to this procedure should be submitted in writing to the Risk Management Committee. Each submission should give details of the proposed amendment and the reason why it is considered necessary.

The Risk Management Committee will keep a log of all change requests, prioritize them for action and, subject to his approval, schedule them for inclusion in the next relevant update of the document. The latest version of this procedure shall be made available via the Qatar Steel computer network. Earlier versions shall be retained for a minimum of three years in accordance with the Qatar Steel document management system.

Hazard Identification, Risk Assessment	Prepared by: HSE Department	
and Risk Management	Issued by:	٦
Page 28 of 40	HSE Department	

Procedure	2.32.2.1.03.01	
Established	28-Mar-1994	
Effective Date	09-Sep-2021	
Revision	1.00	

#### Appendix 4 -Consequence and Frequency Category Definitions

Potential Severity	People	Description
0	No injury	No injury or health effect.
1	Slight injury or health effect	First Aid cases or minor discomfort cases e.g. Headache, dust / fumes / gases having irritation in the nose when inhaled - a person can return back to work after a rest.
2	Minor injury or health effect	Reversible injuries or illnesses requiring Medical Treatment (MTC) or Restricted Workday Cases (RWC) for 5 days or but not LTI's. E.g. loss of consciousness from medical reasons only (e.g. diabetes, epilepsy, narcolepsy etc.), needle stick injuries and cuts from sharp objects.
3	Major injury or health effect	Reversible injuries or illnesses resulting in RWCs for more than 5 days or LTIs e.g. Punctured ear drums, fractured ribs or toes, chronic back injuries, loss of consciousness from work-related activities e.g. blow to the head, heat induced.
4	Single Fatality or permanent total disability	Single fatality, permanent disability or irreversible illness such as corrosive burns, amputation.
5	Multiple fatalities	Multiple fatalities or multiple irreversible illnesses. A near miss with potential for multiple fatalities.

Potential Severity	Assets and Production	Description
0	No damage	No financial impact.
1	Slight damage, (< QAR 50,000)	No disruption to operation, estimated cost less than QAR 50,000.
2	Minor damage (QAR 50,000 to 500,000)	Brief disruption to operation, estimated cost of QAR 50,000 to 500,000
3	Local damage (QAR 0.5M to 5,000,000)	Partial shutdown of operation, estimated cost of QAR 500,000 to 5,000,000.
4	Major damage (QAR 5M to 25,000,000)	Partial loss of operation; estimated cost between QAR 5M to 25,000,000.
	Extensive damage (>QAR 25,000,000)	Substantial or total loss of operation with estimated cost in excess of QAR 25,000,000.

Hazard Identification, Risk Assessment	Prepared by: HSE Department
and Risk Management	Issued by: HSE Department
Page 29 of 40	

Procedure	2.32.2.1.03.01
Established	28-Mar-1994
Effective Date	09-Sep-2021
Revision	1.00

Potential Severity	Environmental	Description
0	No effect	No impact to the environment.
1	Slight effect	No lasting effect.  Low-level impacts on biological or physical environment, local environmental risk within the fence and within the system.  Clean up within days.
2	Minor effect	Minor short-medium term damage to small area of limited significance. Single exceeding of statutory or prescribed limits; single complaint; no permanent effect on the environment. Clean up within weeks.
3	Local effect	Moderate short-medium term widespread impacts, repeated exceeding of statutory or prescribed limits and beyond fence or neighborhood. Clean up within months.
4	Major effect	Severe environmental damage; Qatar Steel is required to take extensive measures to restore the contaminated environment to its original state; extended exceeding of statutory or prescribed limits. Clean up within months – years.
5	Massive effect	Persistent severe environmental damage or severe nuisance extending over a large area; in terms of commercial or recreational use or nature conservancy, a major economic loss for Qatar Steel; constant high exceeding of statutory or prescribed limits. Long term clean up required.

Potential Severity	Reputation	Description
0	No impact	No reputational impact.
1	Slight impact	Public awareness may exist but there is no public concern.
2	Limited impact	Some local public concern; some local media or local political attention with potentially adverse aspects for Qatar Steel operations.
3	National impact	National public concern; extensive adverse attention in the national media. Significant difficulties in gaining approvals.
4	Regional impact	Extensive adverse attention in the regional media; regional public and political concern. May lose consent to operate or not gain approval.  Management credentials are significantly tarnished.
5	International impact	Extensive adverse attention in international media; international public attention. Consent to operate threatened. Reputation severely tarnished.

Hazard Identification, Risk Assessment	Prepared by: HSE Department
and Risk Management	Issued by: HSE Department
Page 30 of 40	11312 Department

Procedure	2.32.2.1.03.01
Established	28-Mar-1994
Effective Date	09-Sep-2021
Revision	1.00

Potential Probability	Qualitative Definition	Description
Α	Remote	Have occurred in the Steel Industry Worldwide but not in Qatar Steel. Almost inconceivable that event will happen in Qatar Steel.
В	Unlikely	Have occurred in other similar companies but not in Qatar Steel. Not likely to happen (but could) in Qatar Steel.
a C	Occasional	Has occurred in Qatar Steel. An activity or event occurs infrequently or irregularly.
D	Likely	Occurs several times a year in Qatar Steel. The event is repeatable and occurs often if events follow normal patterns.
E	Frequent	Occurs several times a year in same location or operation within Qatar Steel. Will be continuously experienced unless action is taken to change events

#### Appendix 5 - Guidelines to check for Potential Hazards for MMI

#### **Physical Hazards**

Hazard Type	Potential Consequences	
Mechanical		
1. Acceleration/deceleration	Being thrown	
2. Kinetic energy	Crushing	
3. Angular parts	Cutting or severing	
4. Approach of a moving element to a fixed part	Drawing-in or trapping	
5. Cutting parts	Entanglement	
6. Elastic elements	Friction or abrasion	
7. Falling objects	Impact	
8. Gravity	Injection	
9. Stored energy	Shearing	
10. Height from the ground	Slipping, tripping or falling	
11. High pressure	Stabbing or puncturing	
12. Machinery mobility	Suffication	
13. Moving elements	Being run over	
14. Rotating elements		
15. Surface finish (rough or slippery)		
16. Sharp edges		
17. Instability		
18. Vacuum		
Electrical		
I. Arc	Chemical effects	
2. Electromagnetic phenomena	Effects on medical implants	
. Electrostatic phenomena	Electrocution	
. Live parts	Falling or being thrown	
Insufficient distance from live parts under high	Fire	
voltage		
. Overload	Projection of molten particles	
. Parts becoming live under fault conditions	Shock	
. Short-circuit	Burn	
. Thermal radiation		
hermal		
. Explosion	Burn	
. Flame	Dehydration	
Objects or materials with a high or low temperature	Discomfort	

Hazard Identification, Risk Assessment and Risk Management	Prepared by: HSE Department Issued by: HSE Department

Effective Date	09-Sep-2021
Revision	1.00

4.	Radiation from heat sources	Frostbite
		Injuries from radiated heat
		Scald
No	ise	
1.	Cavitation phenomena	Discomfort
2.	Exhaust system	Loss of awareness
3.	High-speed gas leak	Loss of balance
4.	Manufacturing process (e.g. stamping, pressing, grinding)	Permanent hearing loss
5.	Moving parts	Stress
6.	Scraping surfaces	Tinnitus
7.	Unbalanced rotating parts	Tiredness
8.	Whistling pneumatics	
9.	Worn parts	
Vil	pration	
1.	Cavitation phenomena	Discomfort
2.	Misalignment of moving parts	Low-back disease
3.	Mobile equipment	Neurological disorder
4.	Scraping surfaces	Osteoarticular disorder
5.	Unbalanced rotating parts	Trauma of the spine
6.	Vibrating equipment	Vascular disorder
7.	Worn parts	
Rac	liation	
1.	Ionizing radiation source	Burn
2.	Low-frequency electromagnetic radiation	Damage to eyes and skin
3.	Optical radiation (IR, visible, UV), including laser	Effects on reproductive capability
4.	Radio frequency electromagnetic radiation	Genetic mutation
		Headache, insomnia, etc.
Mat	terials/Substances	
1.	Aerosol	Breathing difficulties, suffocation
2.	Biological and microbiological (viral or bacterial) agent	Cancer
3.	Combustible	Corrosion
4.	Dust	Effects on reproductive capability
5.	Explosive	Explosion
3.	Fiber	Fire
7,	Flammable	Infection
₿,	Fluid	Mutation

9. Fume	Poisoning	
10. Gas	Sensitization	
11. Mist		
12. Oxidizer		

#### Hazardous Tasks

#### Transport Lifting Loading Packing 4. Transportation Unloading 6. Unpacking Assembly, Installation and Commissioning Preparations for installation (e.g. foundations, vibration isolators) 2. Assembly of the machine 3. Fixing, anchoring 4. Connection to energy supplies (e.g. electricity, compressed air) Connecting to disposal system (e.g. for exhaust gases, waste water) 6. Adjustment of the machine and its components 8. Feeding, filling, loading of ancillary fluids (e.g. lubricants, adhesives) 9. Testing 10. Running the machine without load 11. Trials with load or maximum load 12. Demonstration Setting, Teaching, Programming and/or Process Changeover Mounting or changing tools, tool-setting Adjustment and setting of protective devices and other components 2. 3. Adjustment and setting functional parameters (e.g. speed, pressure, force, travel limits) 4. Clamping/fastening the work piece 5. Feeding, filling, loading of raw material 6. Program verification 7. Functional test, trials Verification of the final product Operation Clamping/fastening the work piece
